

TalkRPN cell - centreline skeleton

No stroke width, no slant. Origin is the top-left centreline corner; x right, y down.
Units are the HP-01's centreline box (53.5 x 91.5) scaled by 100/91.5 = 1.0929, so cap height is exactly 100.
29 bars + COL1 + COL2 + DP + COMMA = 33 elements; the mask is a Long. Blue: A3/D3 are ALTERNATIVES to A4/D4; A5/D5 are the right-paren halves.
Segments meet flush - no gaps, unlike the DL-3422. TalkRpnFont.kt is the source of truth.

RELATIONSHIPS

hook radius = hook start x = 7.92, so each arc is tangent to both bar and column

F1 top = 7.92 = where A3 lands. E1 bottom = 92.08 = where D3 lands.

F2 and E2 are the stubs that carry the left column out to the corner when it is square.

B = C = 50.00: the right column is undivided at the corners, which is what makes a 4 lopsided.

N and O are inset 3.74 and 3.75 from the columns - symmetric to within measurement.

THE THREE LEFT-COLUMN ENDINGS

square A4 + F2 most letters

hooked A3 + F1 0 2 3 5 7 8 9, A C G O Q S, (& and @ (F2 dark)

short F1 alone digit 4, no A at all - left side sits 7.92 lower than the right

WHY THE LETTER V IS DRAWN SIDeways

A textbook V is two arms meeting at the bottom centre. The left arm exists - segment J runs from the left column at the middle down to the bottom centre - but no mirrored segment exists on the right. So the letter V is the left column plus the full slash (segment I into segment L), as on the DL-3422. A mirror of segment J would allow a textbook V and a pointier W.
